The present invention relates to a method to Enable / Disable factory set fixed protections. The method comprises storing of the protection state in a non volatile memory means of a microcontroller, sensing by means of said microcontroller the state of the protection from a non volatile memory means and checking of said state of protection adapted to decide whether to check for fault or not to check for fault. The protection state is checked and if it is disabled the said microcontroller does not issue trip even when fault is detected and if the state is enabled said microcontroller issues trip if fault is detected. The invention also relates to a system to Enable / Disable factory set fixed protection settings.
